INTRODUCTION TO CSS

HTML -> What to display

CSS -> How to display

CSS Syntax

```
p {

  color : red;

  }
```

p -> selector

color -> property name

red -> value

Three ways of inserting CSS :

- **External CSS** – Adding External CSS file to HTML using <link> element.
- **Internal CSS** – Internal Style is given using <style> tag under <head> tag in HTML.
- **Inline CSS** – Applying unique style to a particular element inside HTML.

Priority of CSS

- **Inline CSS** – Highest priority
- **Internal CSS** – Second Highest priority
- **External CSS** – Least priority

CSS Comments

Comments are used to document the source code. They are not displayed in the browser. We have single-line and multi-line comment defined by */* comment */*

There are three main CSS selectors:

- **Element selector** – selects HTML elements and styles the CSS.
- **Id selector** – unique element within a file. It can be used only once for styling one element. To select specific id, use hash (#) character followed by id name.
- **Class selector** – select elements with a class attribute for styling. Use (.) period character followed by class name.
